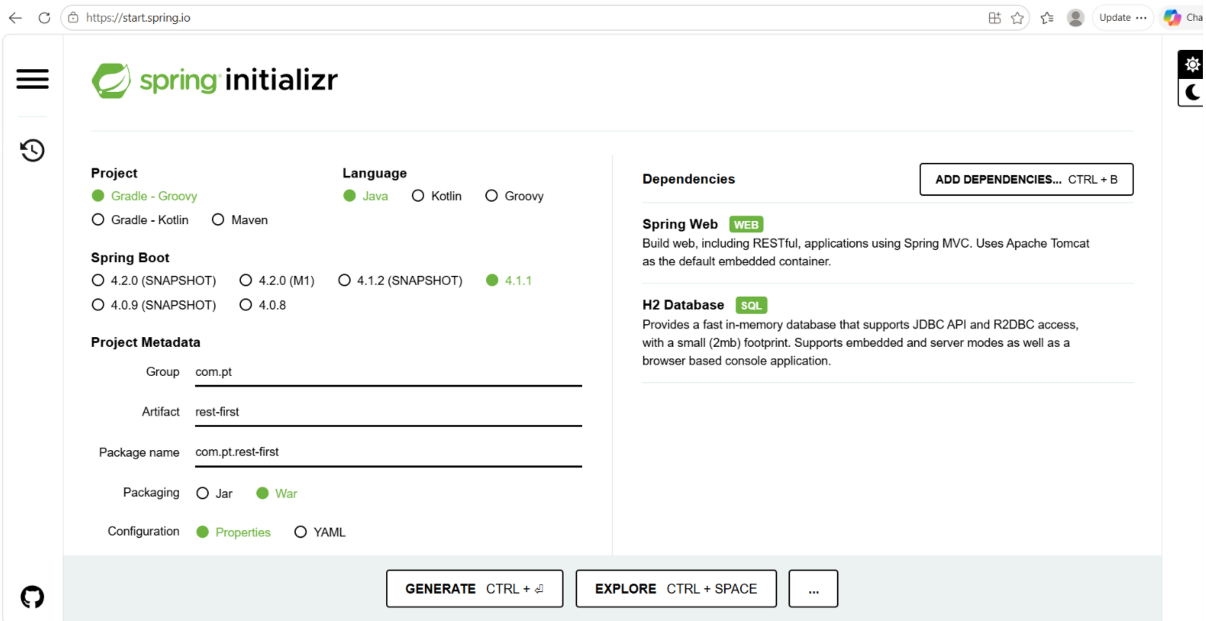
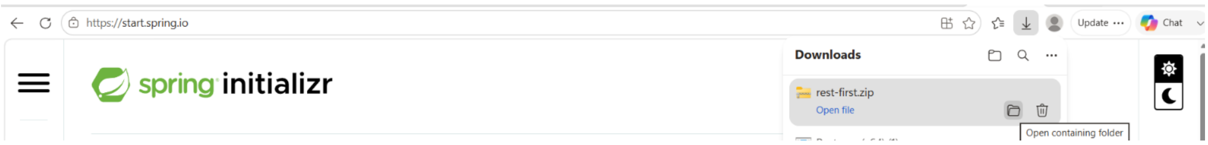
Steps to create REST Microservice using Spring Boot

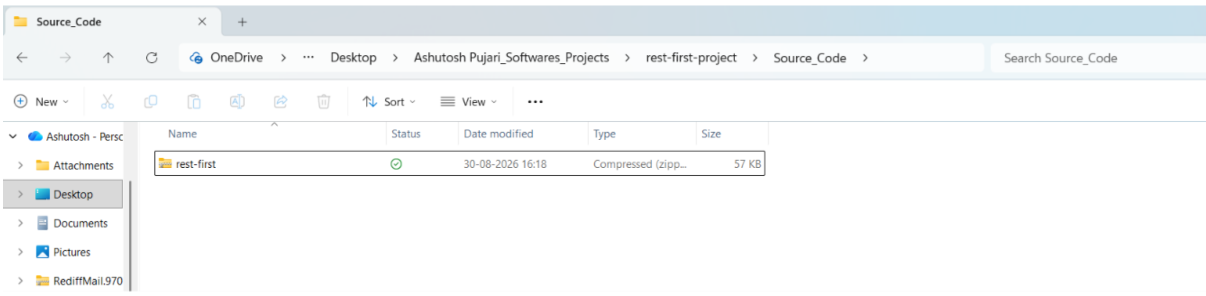
Step 1: create spring boot application using https://start.spring.io. Add spring web and H2 database dependencies. Click **Generate CTRL+** button to generate basic spring boot code.



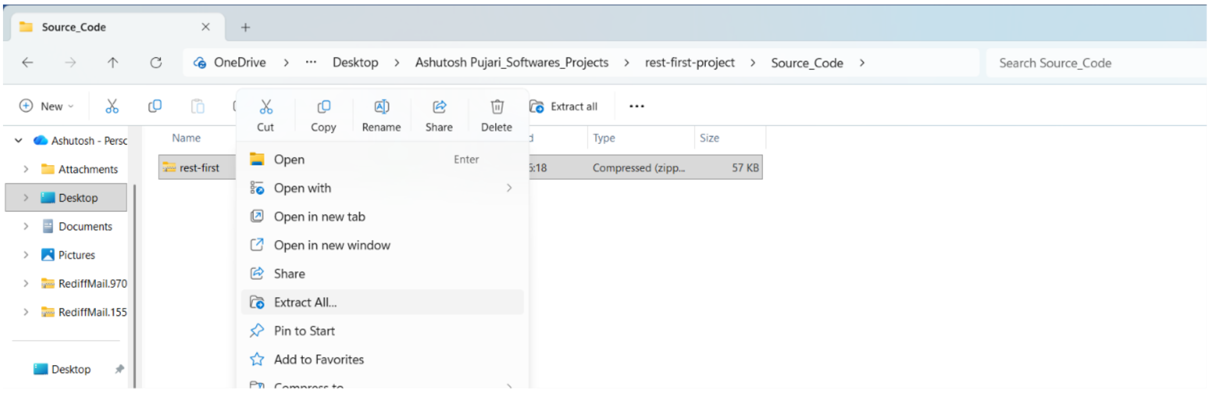
Step 2: Code will get generated and zip file will be created in downloads folder.

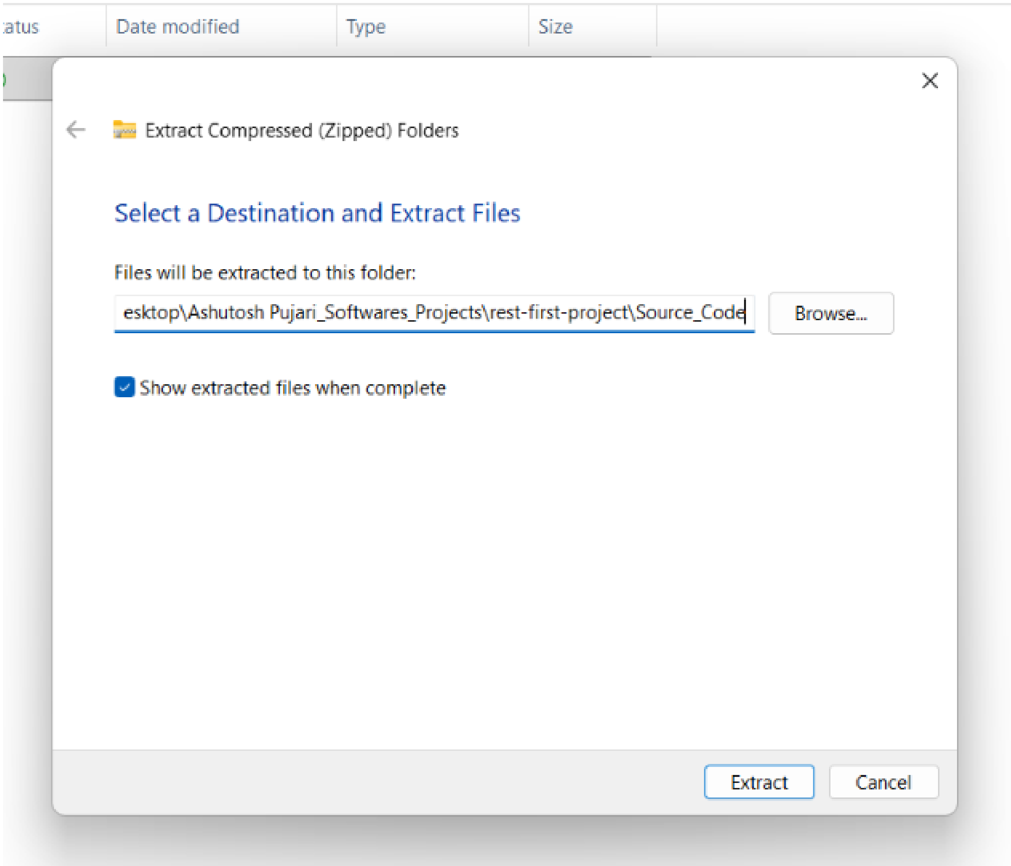


Step 3: Copy zip file Code from downloads and paste in your respective folder.

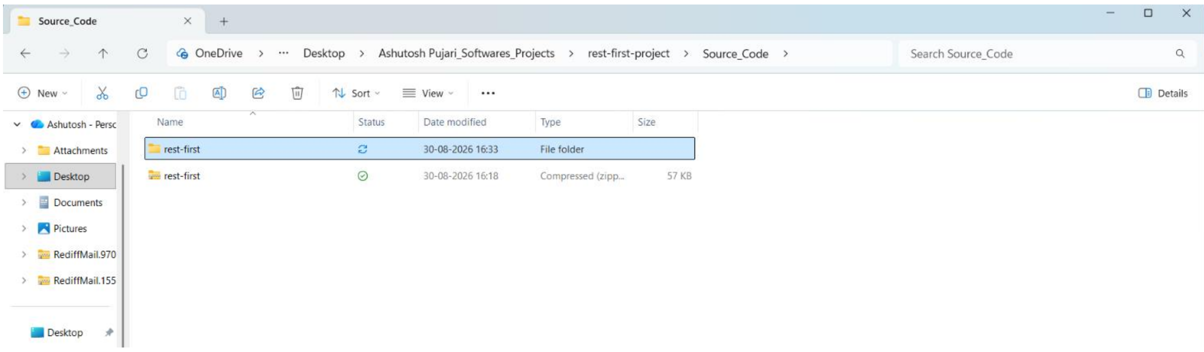


Step 4: Extract the zip file and unzip the code as shown below.

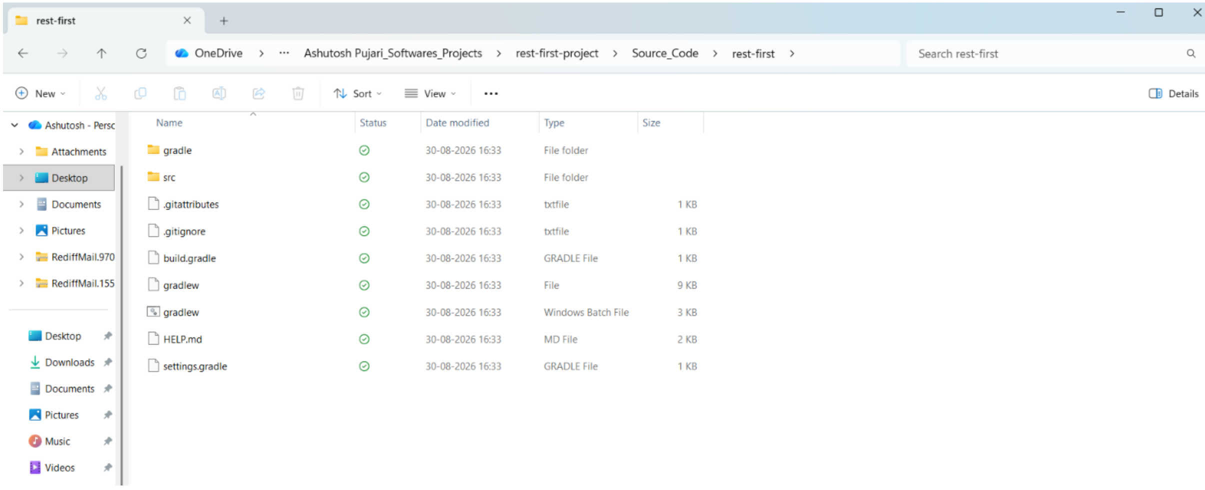




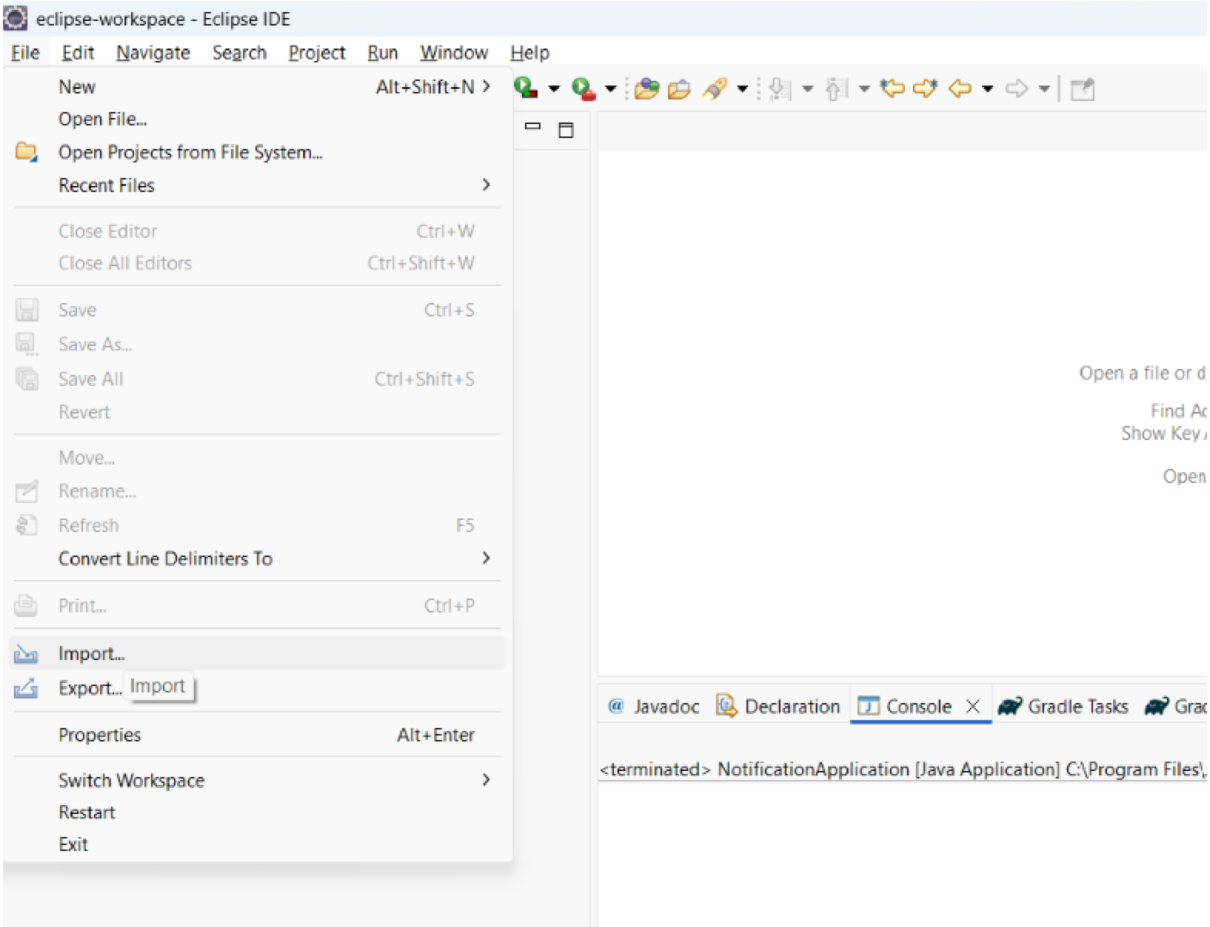
Step 5: You should now be able to see the generated project folder as shown below.

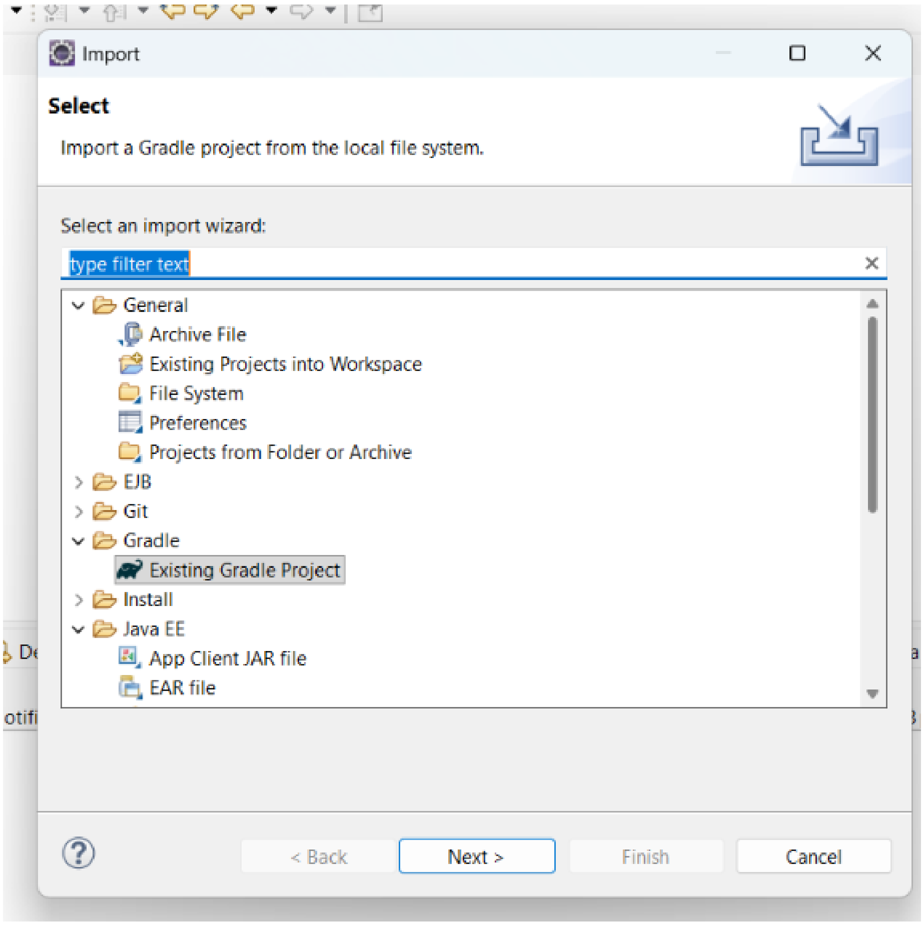


Step 6: You should be able to see project folder structure as shown below.



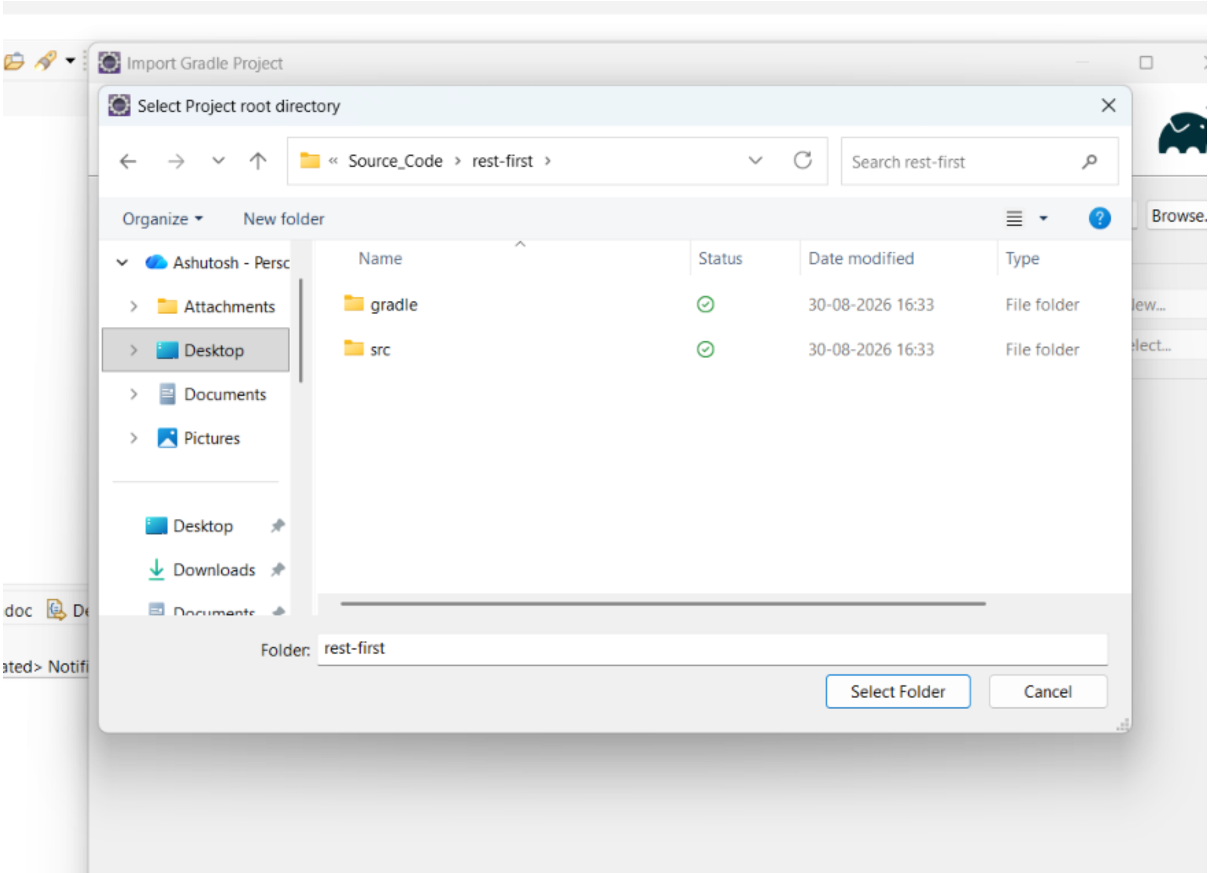
Step 7: Now Import Project in Eclipse as shown in below screens. Please note, this is a gradle based project.



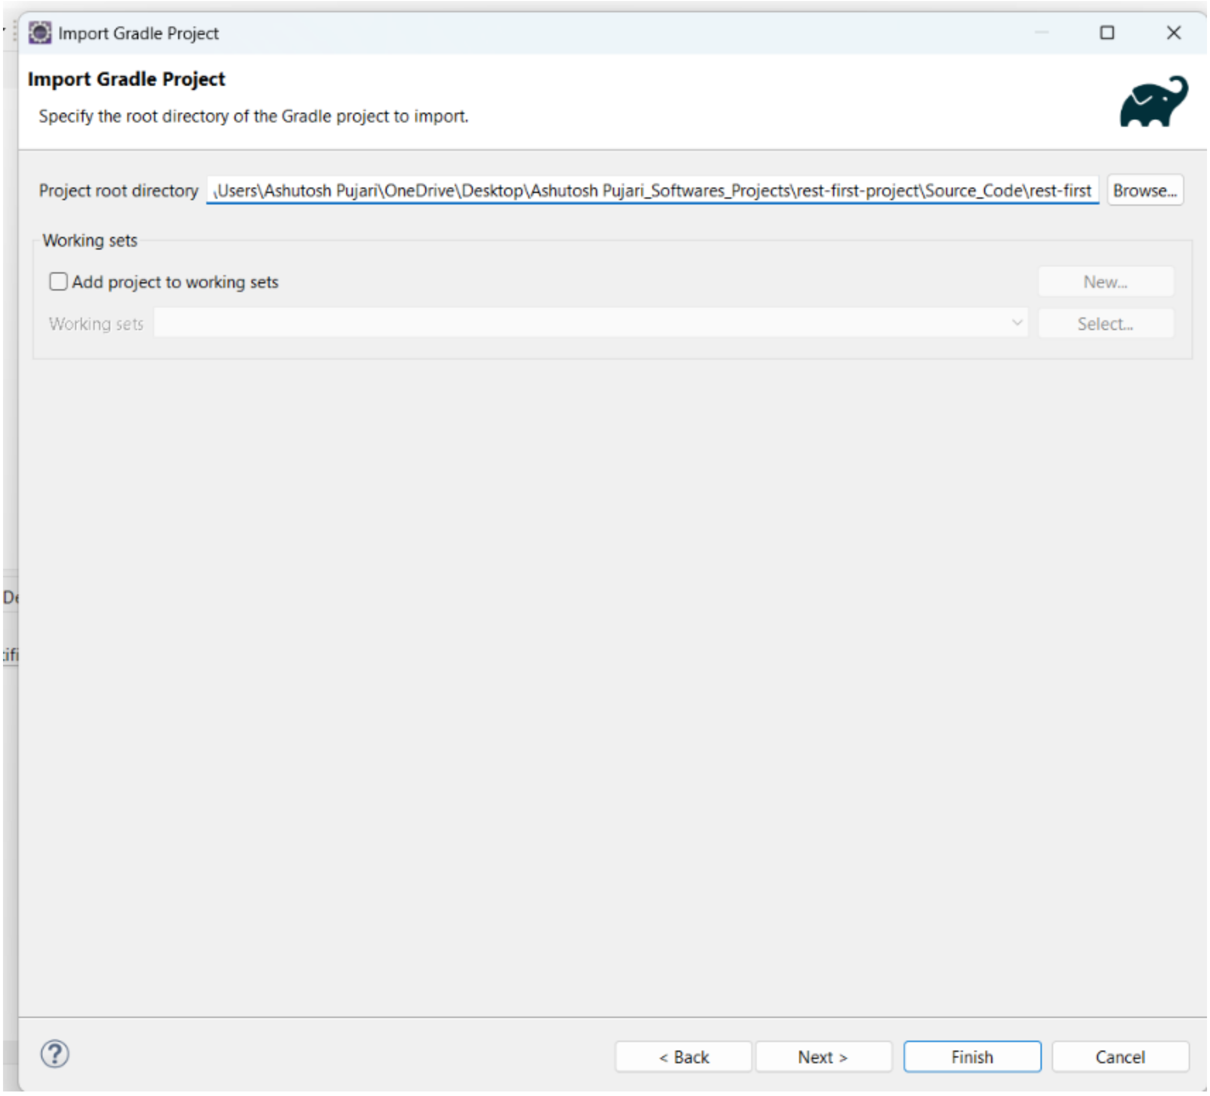


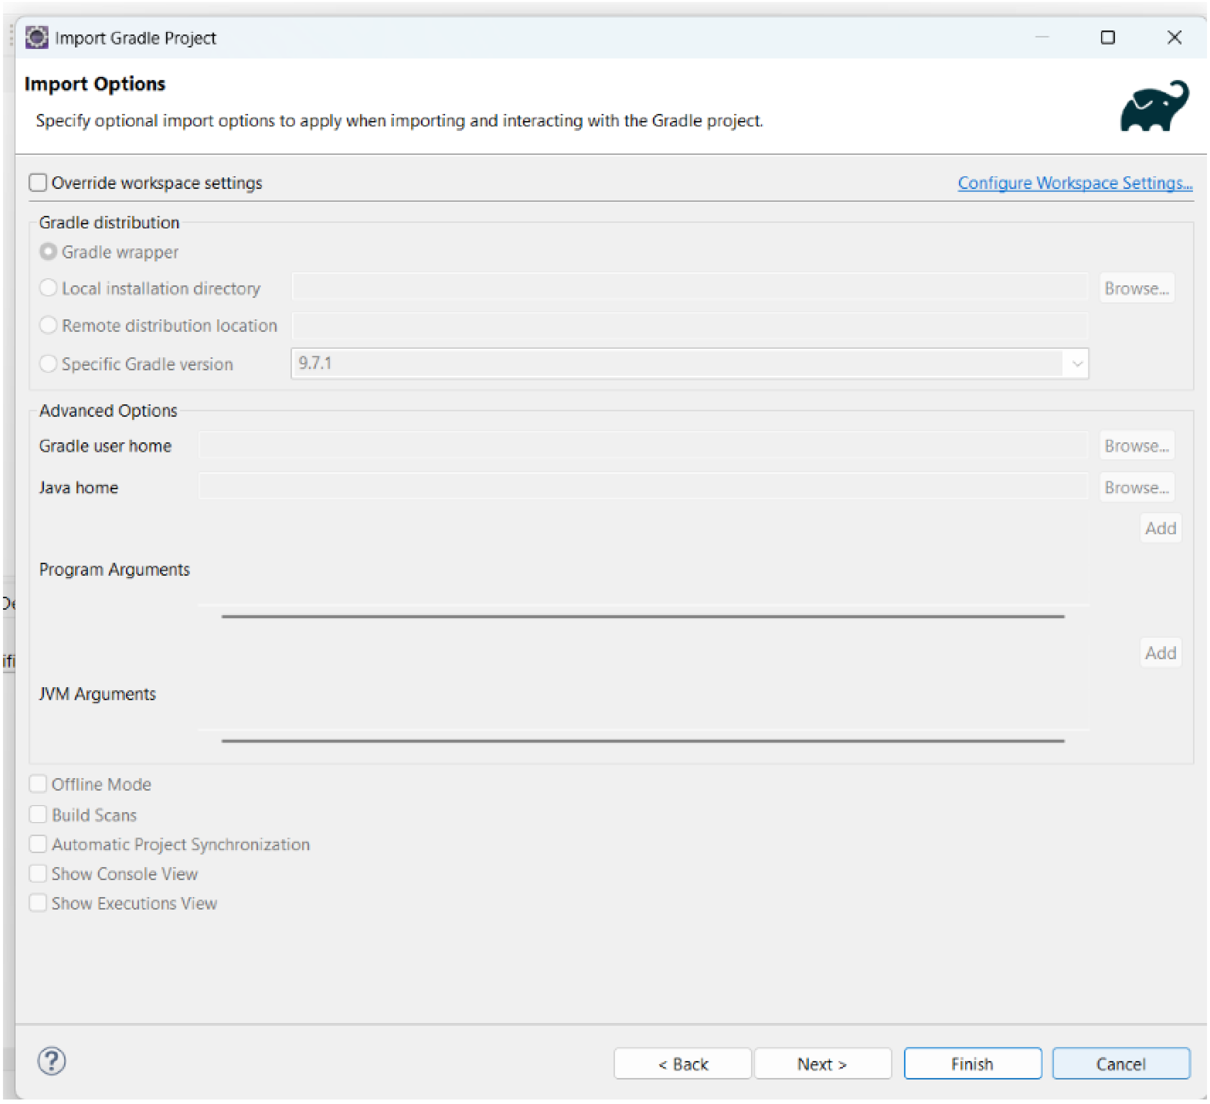
Import
Select
Import a Gradle project from the local file system.
Select an import wizard:
type filter text
General
Archive File
Existing Projects into Workspace
File System
Preferences
Projects from Folder or Archive
EJB
Git
Gradle
Existing Gradle Project
Install
Java EE
App Client JAR file
EAR file
< Back
Next >
Finish
Cancel

Step 8: Next you need to select project folder from your respective folder as shown below. This should be your root project folder, which got created after extracting zip file.



Step 9: Click **Next** button. Select default options till last screen.





Import Gradle Project
Import Options
Specify optional import options to apply when importing and interacting with the Gradle project.
Override workspace settings
Configure Workspace Settings...

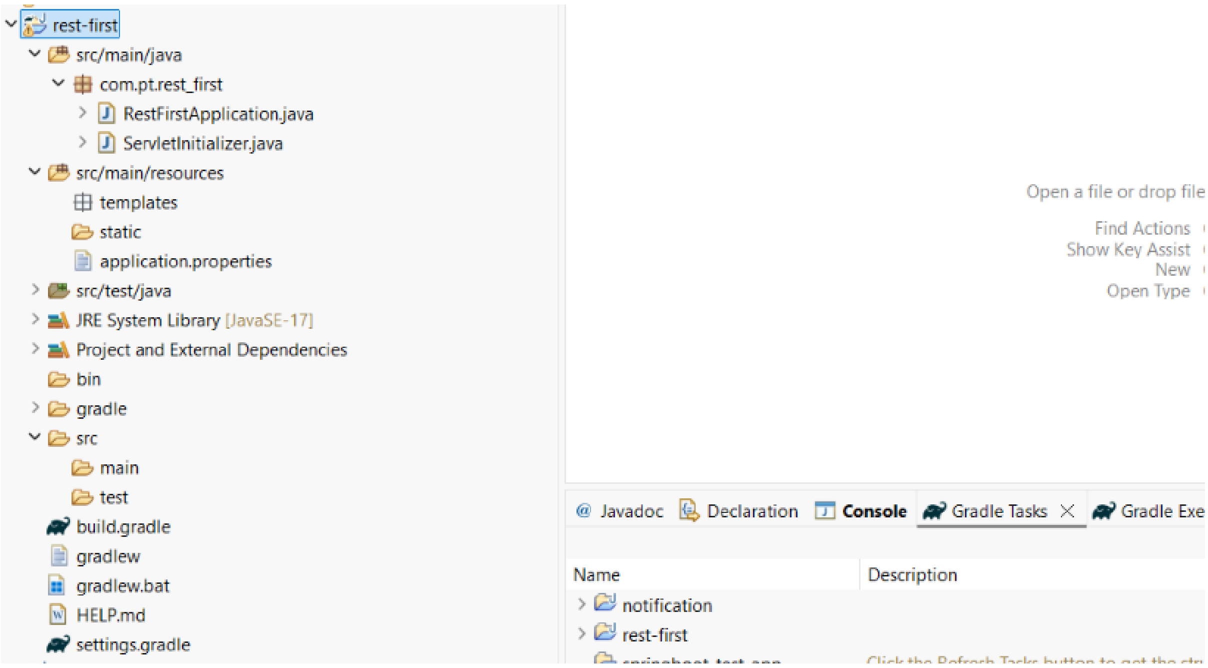
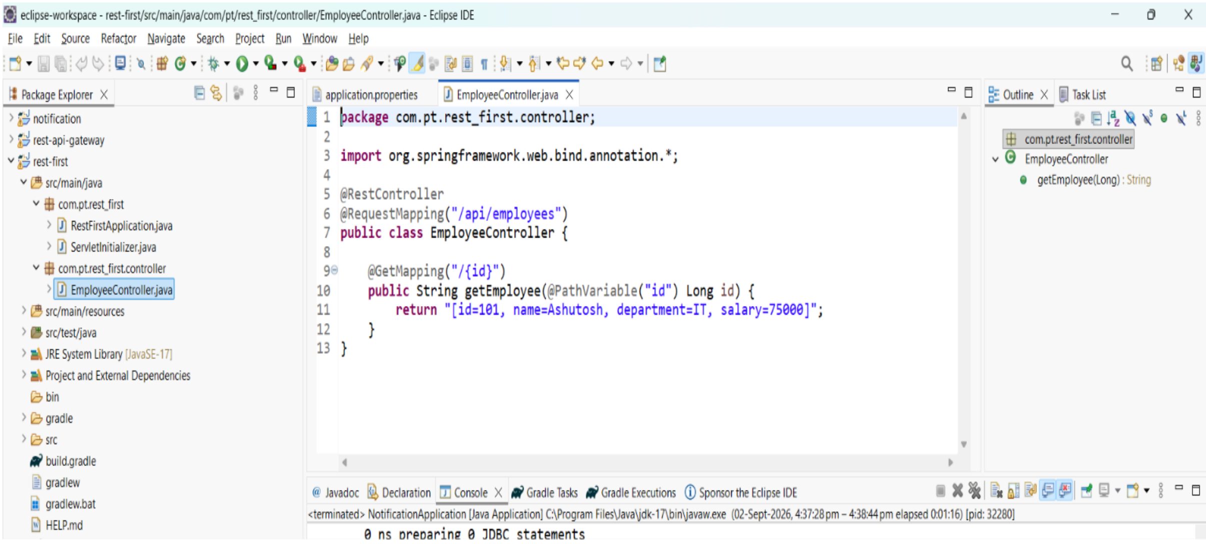
Import Gradle Project
Import Preview
Review the import configuration before starting the import of the Gradle project.
Project root directory:
C:\Users\Ashutosh Pujari\OneDrive\Desktop\Ashutosh Pujari_Softwares_Projects\rest-first-project\Source_Code\rest-first
Gradle user home directory:
C:\Users\Ashutosh Pujari\.gradle
Gradle distribution:
Gradle wrapper from target build
Gradle version:
9.7.1
Java home directory:
C:\Users\Ashutosh Pujari\.p2\pool\plugins\org.eclipse.justj.openjdk.hotspot.jre.full.win32.x86_64_21.0.12.v20260801-1229\jre
Gradle project structure:
rest-first
< Back
Next >
Finish
Cancel

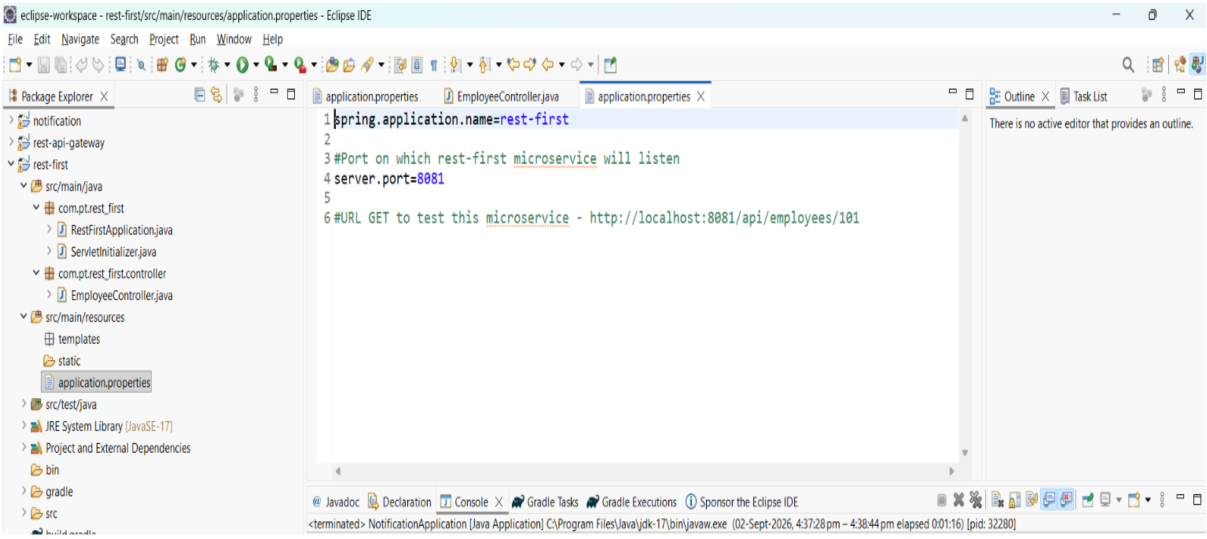
Step 10: Click **Finish** button. The project gets imported in Eclipse as shown below.



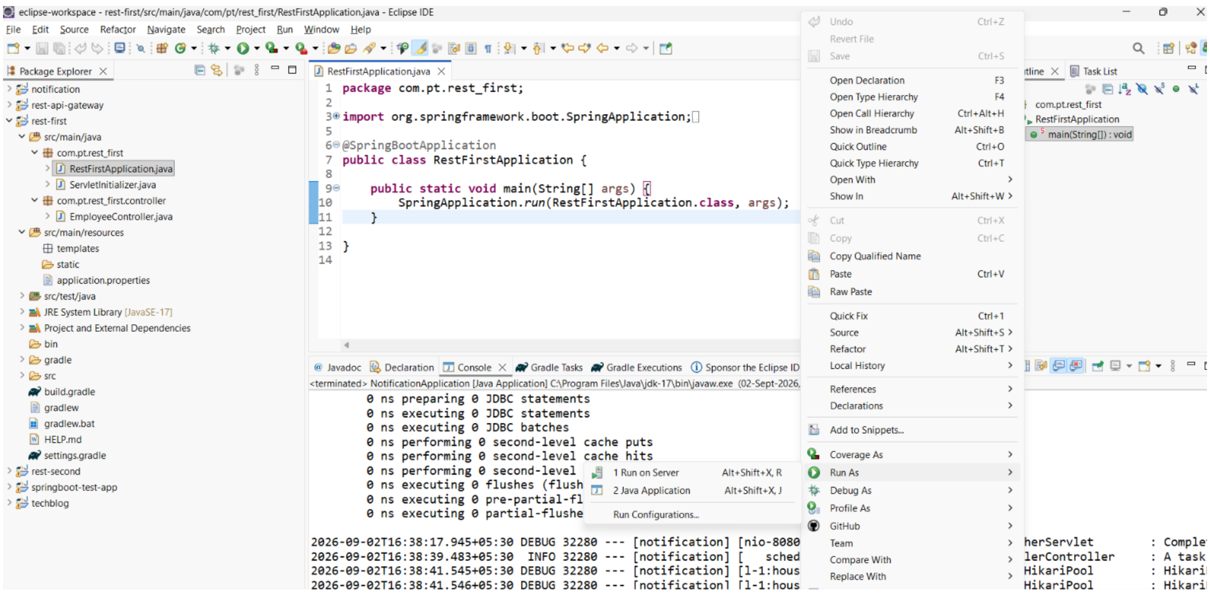
Step 11: Create EmployeeController class which will be your REST API.



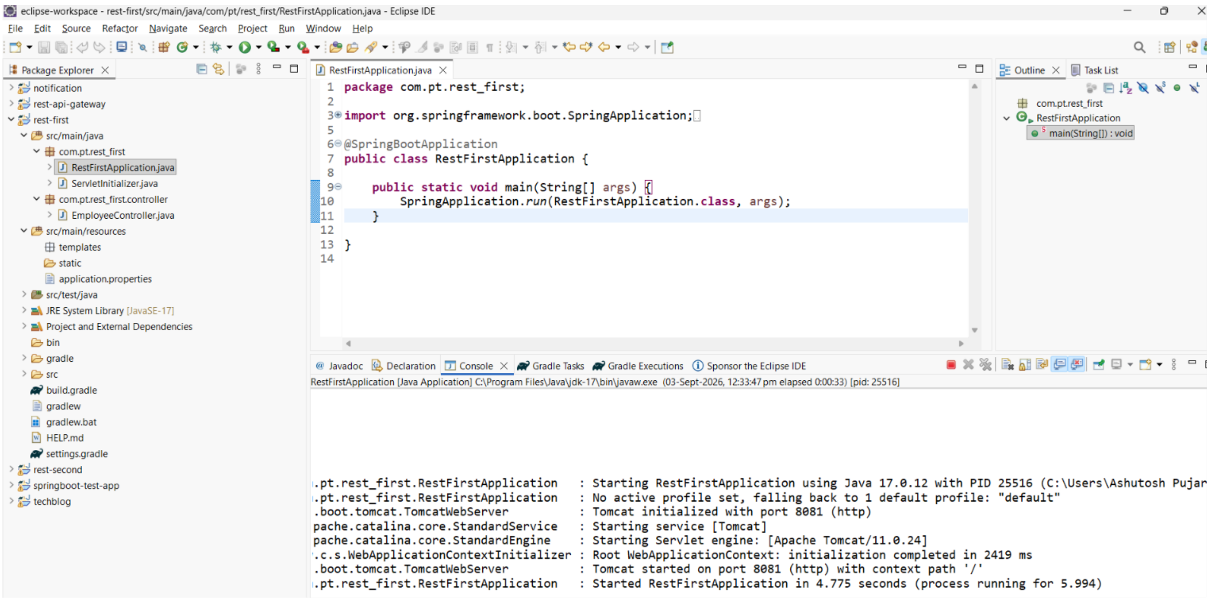
Step 12: Below is **application.properties** file, where you specify configurations. This REST application will be running on port 8081



Step 13: The REST API is ready. Now you can start the application as shown below:

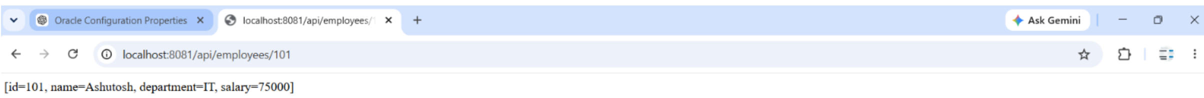


The application will be UP and RUNNING as shown below.



Step 14: Now we need to test the REST API. Open any browser and provide REST URL as: http://localhost:8081/api/employees/101

You should get the output as shown below.



This completes creation and testing of REST Microservice.
